

ISA CERTIFIED PERSONAL TRAINER COURSE

WEEK 2 – PT SOFT SKILLS AND ACE IFT MODEL

- CHAPTER 2
(THE ACE INTEGRATED FITNESS TRAINING
MODEL)
- CHAPTER 3
(BASICS OF BEHAVIOUR CHANGE)
- CHAPTER 4
(EFFECTIVE COMMUNICATION, GOAL SETTING
AND TEACHING TECHNIQUES)

CHAPTER 2

THE ACE INTEGRATED FITNESS TRAINING MODEL

CONTENT COVERED

Function Health Fitness Performance
Continuum (Pg 37, Figure 2-1)

Introduction to Cardiorespiratory
Training – Base, Fitness and
Performance (Pg 42-45)

Introduction to Muscular Training
– Functional, Movement, Load /
Speed (Pg 46-48)

Introduction to Client-Centered Approach to
PT: ACE Mover Method (Pg 39)

ACE→ Integrated Fitness Training® Model

Introduction to ACE IFT Model
(Pg 38, Figure 2-2)

TRADITIONAL TRAINING

[PG 35-36]

Traditional Training

Cardiorespiratory

Muscular Endurance

Muscular Strength

Flexibility

CONTEMPORARY TRAINING

FUNCTION-HEALTH-FITNESS-PERFORMANCE CONTINUUM

Figure 2-1: The function-health-fitness-performance continuum

Personal trainer helps the clients in their journey along the continuum.

THE ACE IFT MODEL

ACE → Integrated Fitness Training® Model

Emphasis is on using a Client-Centric Approach

Figure 2-2: ACE Integrated Fitness Training Model

CARDIORESPIRATORY TRAINING

Cardiorespiratory Training

Base Training	▶ Focus on moderate-intensity cardiorespiratory exercise (RPE = 3 to 4), while keeping an emphasis on enjoyment. ▶ Keep intensities <u>below the talk-test threshold (below VT1).</u> ▶ Increase duration and frequency of exercise bouts. ▶ Progress to Fitness Training when the <u>client can complete at least 20 minutes</u> of cardiorespiratory exercise below the talk test threshold.
Fitness Training	▶ Progress cardiorespiratory exercise duration and frequency based on the client's goals and available time. ▶ Integrate <u>vigorous-intensity (RPE = 5 to 6)</u> cardiorespiratory exercise intervals with segments performed at intensities below, at, and above VT1 to just below VT2.
Performance Training	▶ Progress moderate- and vigorous-intensity cardiorespiratory exercise. ▶ Program sufficient volume for the client to achieve goals. ▶ Integrate <u>near-maximal and maximal intensity (RPE = 7 to 10)</u> intervals performed at and above VT2 to increase aerobic capacity, speed, and performance. ▶ <u>Periodized training plans</u> can be used to incorporate adequate training time below VT1, from VT1 to just below VT2, and at or above VT2.

Note: RPE = Rating of perceived exertion (0 to 10 scale); VT1 = First ventilatory threshold; VT2 = Second ventilatory threshold

Table 2-2: Summary of 3 Phases of Cardiorespiratory Training

CARDIORESPIRATORY TRAINING

[PG 45]

Why each phase is important?

Base Training –

1st good experience and
increase regularity of exercise

Fitness Training –

Enhancing aerobic efficiency and
facilitate physiological adaptation

Performance Training –

Goals on success in endurance
sports and events

MUSCULAR TRAINING

Functional Training	▶ Focus on establishing/reestablishing <u>postural stability and kinetic chain mobility</u>. ▶ Exercise programs should improve muscular endurance, flexibility, core function, and static and dynamic balance. ▶ Progress exercise volume and challenge as function improves.
Movement Training	▶ Focus on developing good movement patterns without compromising postural or joint stability. ▶ Programs should include exercises for <u>all five primary movement patterns</u> in varied planes of motion. ▶ Integrate Functional Training exercises to help clients maintain and improve postural stability and kinetic chain mobility.
Load/Speed Training	▶ Focus on application of <u>external loads to movements</u> to create increased force production to meet desired goals. ▶ Integrate the five primary movement patterns through exercises that load them in different planes of motion and combinations. ▶ Integrate <u>Functional Training exercises</u> to enhance postural stability and kinetic chain mobility to support increased workloads. ▶ Programs should focus on adequate resistance training loads to help clients reach muscular strength, endurance, and hypertrophy goals. ▶ Clients with goals for athletic performance will integrate exercises and drills to build speed, agility, quickness, and power.

Table 2-3: Summary of 3 Phases of Muscular Training

MUSCULAR TRAINING: 1ST STAGE - FUNCTIONAL TRAINING

Goals

Re-establishing postural stability
and kinetic chain mobility

Exercises

Body weight, core
and balance

Benefits

Improve strength of muscles
responsible for stabilising the spine
and center of gravity (COG) during
static and dynamic movements

MUSCULAR TRAINING: 2ND STAGE – MOVEMENT TRAINING

Push

Pull

Range of Movement

Rotation

Single Leg

Bend & Lift

MUSCULAR TRAINING: 2ND STAGE – MOVEMENT TRAINING

Examples of Exercises
involving 5 Primary
Movement Patterns

MUSCULAR TRAINING: 3RD STAGE – LOAD / SPEED TRAINING

- External Forces like weight plates, dumbbells, kettlebells, battle ropes
- Force production
- Enhance muscular adaptation
- Load in resistance training include HIIT, plyometrics and power lifting
